EDUCATION

University of Minnesota, College of Science and Engineering

Minneapolis, MN

Master's of Science, Robotics, Minor in Mechanical Engineering

5/2026 – 9/2024

GPA: 4.00

University of Minnesota, College of Science and Engineering

Minneapolis, MN

Bachelor of Science, Computer Engineering

9/2020 – 5/2024

GPA: 3.52

TECHNICAL SKILLS

Robotics: Computer Vision, Machine Learning, AI, Path Planning, Kalman Filtering, Feedback Control, Force Feedback

Programming: C, C++, Java, Python, ROS, Bash, MATLAB, Verilog

Mechanical: SolidWorks, RoboDK, 3d Printing (SLA and FDM), Machine shop trained 100+ hours (mill, lathe, waterjet)

Electrical: DC/AC circuit analysis, Altium PCB Designer, Vivado FPGA

Tools and Platforms: Git, Jira, Confluence, Linux, NumPy, PyTorch, TensorFlow

JOB EXPERIENCE

University of Minnesota and Medtronic

Minneapolis, MN

Mechatronic Lead for Autonomous Telerobotic Surgical Stroke Robot

6/2025 – 5/2026

- Built an automated test platform using an ATI Nano17 6-DOF force/torque sensor and a stepper-actuated test rig to characterize prototype performance, accelerate wear, and identify failure modes to promote device longevity.
- Designed, manufactured, and tested iterative robot prototypes, using results to verify and inform design revisions.
- Designed and implemented a motor control architecture enabling precise control of the guidewire propulsion mechanism.

General Dynamics Mission Systems

Bloomington, Minnesota

Software Engineering Intern

5/2022 – 8/2022

- Translated the existing test environment from Bash into Python to improve readability and package support.
- Anticipated future requirements and implemented unit and system tests into the active test environment.
- Contributed to professional documentation through Confluence, understood team workflow through Jira, and streamlined version control through GitLab.

PUBLICATIONS

Friction Characterization of a Roller-Drive Mechanism for Robotic Motion Control of Guidewires

DMD 2026

PROJECT EXPERIENCE

Robotics Club projects (Robo Master, NASA Lunabotics, Robot in Three Days)

1/2021 – Present

- Work under a three-day time crunch to design and manufacture a robot to meet competition requirements.
- Created a custom neural stack to identify, track, and predict robot motion in a moving-camera, moving-target environment, achieving 98% classification accuracy with a 3 ms loop time.
- Collaborate with my team to design, manufacture, and validate robotic subsystems to ensure reliable task performance.

Intermediate Robotics Project

9/2024 – 12/2024

- Implemented kinematics, self-motion, path planning, and Jacobian IK for a hyper-redundant planar robot
- Used torque measurements to implement feedback and measure the effects of delay on manipulability
- Developed methods for control, teleoperation, and feedback for UR5 Robot over TCP/IP Ethernet

Robot Vision Final Project

9/2024 – 12/2024

- Designed and built from scratch an autonomous 6 DOF arm able to simulate industrial pick-and-place tasks
- Developed and debugged a custom position-based visual servoing algorithm to allow for dynamic object tracking.

Autonomous Quadrotor for Education

12/2023 – 5/2024

- Assisted in exploratory research, completing the initial steps in creating a new class for autonomous aerial flight.
- Implemented signal processing and path planning algorithms in a pipeline to allow the real-time position of the drone to be used to follow a path autonomously.
